

LS 129 Organized Notes: Problem Sets

NOTE: HOW TO COPY THE CODE INTO MARKDOWN. Copy it normally, then paste without formatting (Ctrl+Shift+V) into your markdown code block. It will format as expected.

OOP, Reading OO code

Quiz lesson 5

Classes and objects, Encapsulation, working with collaborator objects, public/private/protected methods

Using the class definition from step #3, let's create a few more people -- that is, Person objects.

```
bob = Person.new('Robert Smith')
rob = Person.new('Robert Smith')
```

If we're trying to determine whether the two objects contain the same name, how can we compare the two objects?

[Link #4](#)

Create an empty class named Cat.

[Link](#)

Using the code from the previous exercise, create an instance of Cat and assign it to a variable named kitty.

[Link](#)

```
class Person
  def initialize(name)
    @name = name
  end
end

class Cat
  def initialize(name, owner)
    @name = name
    @owner = owner
  end
end
```

```
sara = Person.new("Sara")
fluffy = Cat.new("Fluffy", sara)
```

Identify all custom defined objects that act as collaborator objects within the

[Link](#) #8

<code>code.</code>	
<pre>class Pet attr_reader :name def initialize(name) @name = name.to_s end def to_s @name.upcase! "My name is #{@name}." end end name = 'Fluffy' fluffy = Pet.new(name) puts fluffy.name puts fluffy puts fluffy.name puts name</pre>	Link
<pre>class Pet attr_reader :name def initialize(name) @name = name.to_s end def to_s @new_name = @name.upcase "My name is #{@new_name}." end end name = 42 fluffy = Pet.new(name) name += 1 puts fluffy.name puts fluffy puts fluffy.name</pre>	

puts name	
-----------	--

Polymorphism, inheritance, modules, method lookup path, duck-typing

What will the following code output?

```
class Animal
  def initialize(name)
    @name = name
  end

  def speak
    puts sound
  end

  def sound
    "#{@name} says "
  end
end

class Cow < Animal
  def sound
    super + "moooooooooooooo!"
  end
end

daisy = Cow.new("Daisy")
daisy.speak
```

[Link #11](#)

```
class Wedding
  attr_reader :guests, :flowers, :songs

  def prepare(preparers)
    preparers.each do |preparer|
      case preparer
      when Chef
        preparer.prepare_food(guests)
      when Decorator
        preparer.decorate_place(flowers)
      when Musician
```

[Link](#)

```
        preparer.prepare_performance(songs)
    end
end
end
end
```

```
class Chef
  def prepare_food(guests)
    # implementation
  end
end
```

```
class Decorator
  def decorate_place(flowers)
    # implementation
  end
end
```

```
class Musician
  def prepare_performance(songs)
    #implementation
  end
end
```

The above code would work, but it is problematic. What is wrong with this code, and how can you fix it?

```
class Character
  attr_accessor :name

  def initialize(name)
    @name = name
  end

  def speak
    "#{@name} is speaking."
  end
end
```

```
class Knight < Character
  def name
    "Sir " + super
  end
end
```

[Link](#) #4

```
end
end

sir_gallant = Knight.new("Gallant")
sir_gallant.name # => "Sir Gallant"
sir_gallant.speak # => "Sir Gallant is speaking."
# What change(s) do you need to make to the above code in order to get the expected output?
```

```
class Animal
  attr_accessor :name

  def initialize(name)
    @name = name
  end
end

class GoodDog < Animal
  def initialize(color)
    super
    @color = color
  end
end

bruno = GoodDog.new("brown")
p bruno.name # What will this return, and why?
```

[Link](#) second example

```
class FarmAnimal
  def speak
    "#{self} says "
  end
end

class Sheep < FarmAnimal
  def speak
    super + "baa!"
  end
end

class Lamb < Sheep
  def speak
    "baaaaaaa!"
  end
end
```

[Link](#) #6

```
end
end

class Cow
  def speak
    super + "mooooooooo!"
  end
end

Sheep.new.speak # => "Sheep says baa!"
Lamb.new.speak # => "Lamb says baa!baaaaaaa!"
Cow.new.speak # => "Cow says mooooooooo!"
# Make the changes necessary in order for this code to return the expected values.
```

```
class Person
  def get_name
    @name # the @name instance variable is not initialized anywhere
  end
end

bob = Person.new
bob.get_name # => ??
# What is the return value, and why?
```

[Link](#)

```
module Swim
  def enable_swimming
    @can_swim = true
  end
end

class Dog
  include Swim

  def swim
    "swimming!" if @can_swim
  end
end

teddy = Dog.new
teddy.swim
# How do you get this code to return "swimming"? What does this demonstrate about instance variables?
```

[Link](#)

```

class Vehicle
  @@wheels = 4

  def self.wheels
    @@wheels
  end
end

Vehicle.wheels          # => ??

class Motorcycle < Vehicle
  @@wheels = 2
end

Motorcycle.wheels       # => ??
Vehicle.wheels          # => ??

class Car < Vehicle
end

Car.wheels               # => ??
# What would the above code return, and why?

```

[Link](#)

```

module Maintenance
  def change_tires
    "Changing #{WHEELS} tires."
  end
end

class Vehicle
  WHEELS = 4
end

class Car < Vehicle
  include Maintenance
end

a_car = Car.new
a_car.change_tires
# Describe the error and provide two different ways to fix it.

```

[Link](#)

```

# Using the following code, allow Truck to accept a second argument upon instantiation.

```

[Link](#)

Name the parameter `bed_type` and implement the modification so that `Car` continues to only accept one argument.

```
class Vehicle
  attr_reader :year

  def initialize(year)
    @year = year
  end
end

class Truck < Vehicle
end

class Car < Vehicle
end

truck1 = Truck.new(1994, 'Short')
puts truck1.year
puts truck1.bed_type
```

Given the following code, modify `#start_engine` in `Truck` by appending 'Drive fast, please!' to the return value of `#start_engine` in `Vehicle`. The 'fast' in 'Drive fast, please!' should be the value of `speed`.

```
class Vehicle
  def start_engine
    'Ready to go!'
  end
end

class Truck < Vehicle
  def start_engine(speed)
  end
end

truck1 = Truck.new
puts truck1.start_engine('fast')
```

Expected output:

[Link](#)

<pre># Ready to go! Drive fast, please!</pre>	
<pre>module Speed def go_fast puts "I am a #{self.class} and going super fast!" end end class Car include Speed def go_slow puts "I am safe and driving slow." end end # When we called the go_fast method from an instance of the Car class (as shown below) you # might have noticed that the string printed when we go fast includes the name of the type # of vehicle we are using. How is this done?</pre>	Link #3
<pre>module Drivable def self.drive "is this possible" end end class Car include Drivable end p Car.drive # What will this return, and why?</pre>	Link
<pre>module EmailFormatter def email "#{first_name}.#{last_name}@#{domain}" end end module EmailSender def email(msg, sender, recipient)</pre>	

<pre># contrived implementation for now puts "Delivering email to #{recipient} from #{sender} with message: #{msg}" end end class User attr_accessor :first_name, :last_name, :domain include EmailFormatter include EmailSender end u = User.new u.first_name = "John" u.last_name = "Smith" u.domain = "example.com" p u.email</pre>	
	https://launchschool.com/exercises/05ac9b2b

Use attr_* to create setter and getter methods, How to call setters and getters, Referencing and setting instance variables vs. using getters and setters

<pre>class GoodDog attr_accessor :name, :height, :weight def initialize(n, h, w) @name = n @height = h @weight = w end def speak "#{name} says arf!" end def change_info(n, h, w) name = n height = h end end</pre>	Link
--	----------------------

```
    weight = w
  end

  def info
    "#{name} weighs #{weight} and is #{height} tall."
  end
end

sparky.change_info('Spartacus', '24 inches', '45 lbs')
puts sparky.info
# => Sparky weighs 10 lbs and is 12 inches tall.

# Why does the .change_info method not work as expected here?
```

```
class Person
  attr_writer :first_name, :last_name

  def full_name
    # omitted code
  end
end

mike = Person.new
mike.first_name = 'Michael'
mike.last_name = 'Garcia'
mike.full_name # => 'Michael Garcia'
```

What code snippet can replace the "omitted code" comment to produce the indicated result?

[Link #15](#)

```
class Student
  attr_accessor :name, :grade

  def initialize(name)
    @name = name
    @grade = nil
  end
end

priya = Student.new("Priya")
priya.change_grade('A')
priya.grade # => "A"
```

[Link #16](#)

<p>The last line in the above code should return "A". Which method(s) can we add to the Student class so the code works as expected?</p>	
<p>In the example above, why would the following not work?</p> <pre>def change_grade(new_grade) grade = new_grade end</pre>	Link #16
<p>Given the below usage of the Person class, code the class definition.</p> <pre>bob = Person.new('bob') bob.name # => 'bob' bob.name = 'Robert' bob.name # => 'Robert'</pre>	Link #1
<p>Modify the class definition from above to facilitate the following methods. Note that there is no name= setter method now.</p> <pre>bob = Person.new('Robert') bob.name # => 'Robert' bob.first_name # => 'Robert' bob.last_name # => '' bob.last_name = 'Smith' bob.name # => 'Robert Smith'</pre> <p>Hint: let first_name and last_name be "states" and create an instance method called name that uses those states.</p>	Link #2
<p>Now create a smart name= method that can take just a first name or a full name, and knows how to set the first_name and last_name appropriately.</p> <pre>bob = Person.new('Robert') bob.name # => 'Robert' bob.first_name # => 'Robert' bob.last_name # => '' bob.last_name = 'Smith' bob.name # => 'Robert Smith'</pre> <pre>bob.name = "John Adams" bob.first_name # => 'John' bob.last_name # => 'Adams'</pre>	Link #3

```

class Animal
  def initialize(name)
    @name = name
  end
end

class Dog < Animal
  def initialize(name); end

  def dog_name
    "bark! bark! #{@name} bark! bark!"
  end
end

teddy = Dog.new("Teddy")
puts teddy.dog_name          # => ??
# What will this return, and why?

```

[Link](#)

```

class Cat
  attr_accessor :name

  def initialize(name)
    @name = name
  end

  def rename(new_name)
    name = new_name
  end
end

kitty = Cat.new('Sophie')
p kitty.name # "Sophie"
kitty.rename('Chloe')
p kitty.name # "Chloe"
# What is wrong with the code above? Why? What principle about getter/setter methods does this demonstrate?

```

[Link](#)

```

class Cat
  attr_accessor :type, :age

  def initialize(type)
    @type = type

```

[Link](#) #8

<pre>@age = 0 end def make_one_year_older self.age += 1 end end</pre> <p>You can see in the <code>make_one_year_older</code> method we have used <code>self</code>. What does <code>self</code> refer to here?</p>	
---	--

Instance methods vs. class methods, `self`, Calling methods with `self`, More about `self`, `to_s`, overriding `to_s`

<p>On which lines in the following code does <code>self</code> refer to the instance of the <code>MeMyselfAndI</code> class referenced by <code>i</code> rather than the class itself? Select all that apply.</p> <pre>class MeMyselfAndI self def self.me self end def myself self end end i = MeMyselfAndI.new</pre>	Link #19
<p>Continuing with our <code>Person</code> class definition, what does the below print out?</p> <pre>bob = Person.new("Robert Smith") puts "The person's name is: #{bob}"</pre>	Link #5a
<p>Let's add a <code>to_s</code> method to the class:</p> <pre>class Person</pre>	Link #5b

<pre># ... rest of class omitted for brevity def to_s name end end Now, what does the below output? bob = Person.new("Robert Smith") puts "The person's name is: #{bob}"</pre>	
<pre>class Student attr_accessor :grade def initialize(name, grade=nil) @name = name end end ade = Student.new('Adewale') ade # => #<Student:0x00000002a88ef8 @grade=nil, @name="Adewale"> # Why does this code not have the expected return value?</pre>	Link #2, D

Fake operators and equality

<pre>arr1 = [1, 2, 3] arr2 = [1, 2, 3] arr1.object_id == arr2.object_id # => ?? sym1 = :something sym2 = :something sym1.object_id == sym2.object_id # => ?? int1 = 5 int2 = 5 int1.object_id == int2.object_id # => ??</pre>	Link
---	----------------------

# What will the code above return and why?	
<pre>class Person attr_accessor :name, :age def initialize(name, age) @name = name @age = age end end bob = Person.new("Bob", 49) kim = Person.new("Kim", 33) puts "bob is older than kim" if bob > kim # How can you make this code function? How is this possible?</pre>	Link
<pre>my_hash = {a: 1, b: 2, c: 3} my_hash << {d: 4} # What happens here, and why?</pre>	Link
<pre>class Team attr_accessor :name, :members def initialize(name) @name = name @members = [] end def <<(person) members.push person end def +(other_team) members + other_team.members end end # we'll use the same Person class from earlier cowboys = Team.new("Dallas Cowboys") cowboys << Person.new("Troy Aikman", 48)</pre>	Link

```
niners = Team.new("San Francisco 49ers")
niners << Person.new("Joe Montana", 59)
dream_team = cowboys + niners          # what is dream_team?
# What does the Team#+ method currently return? What is the problem with this? How could you
fix this problem?
```
